

1. Project Board image

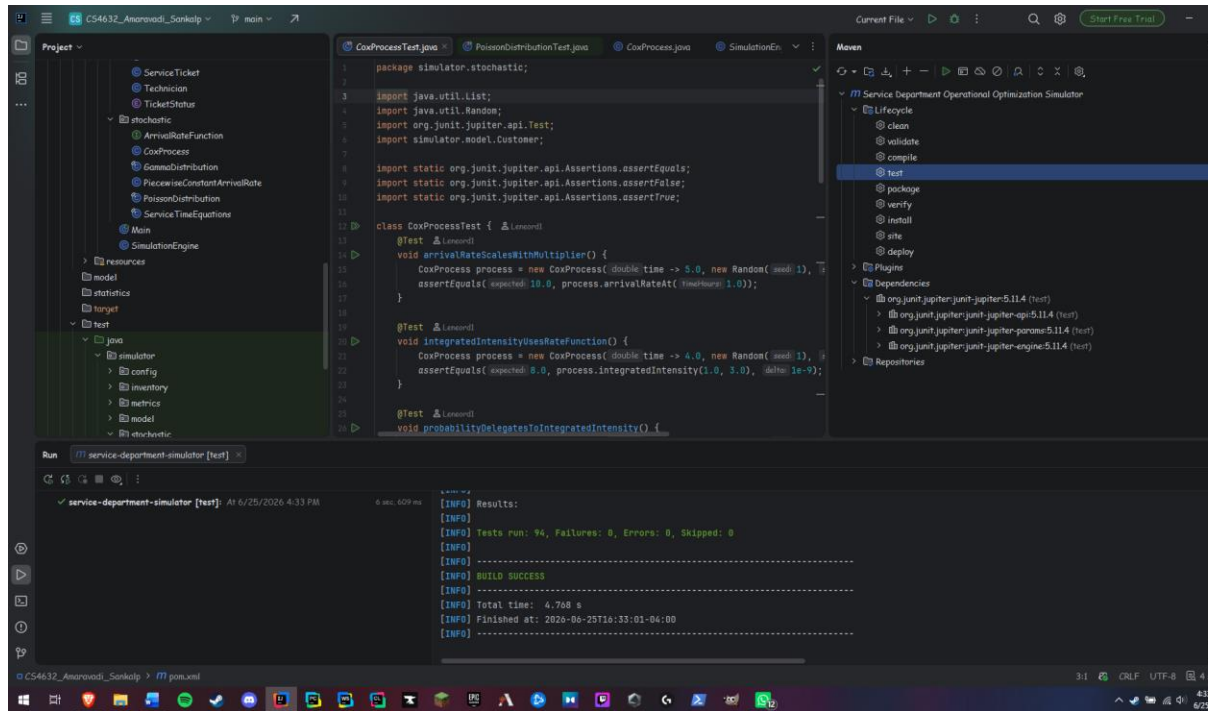

2. Implementation Status

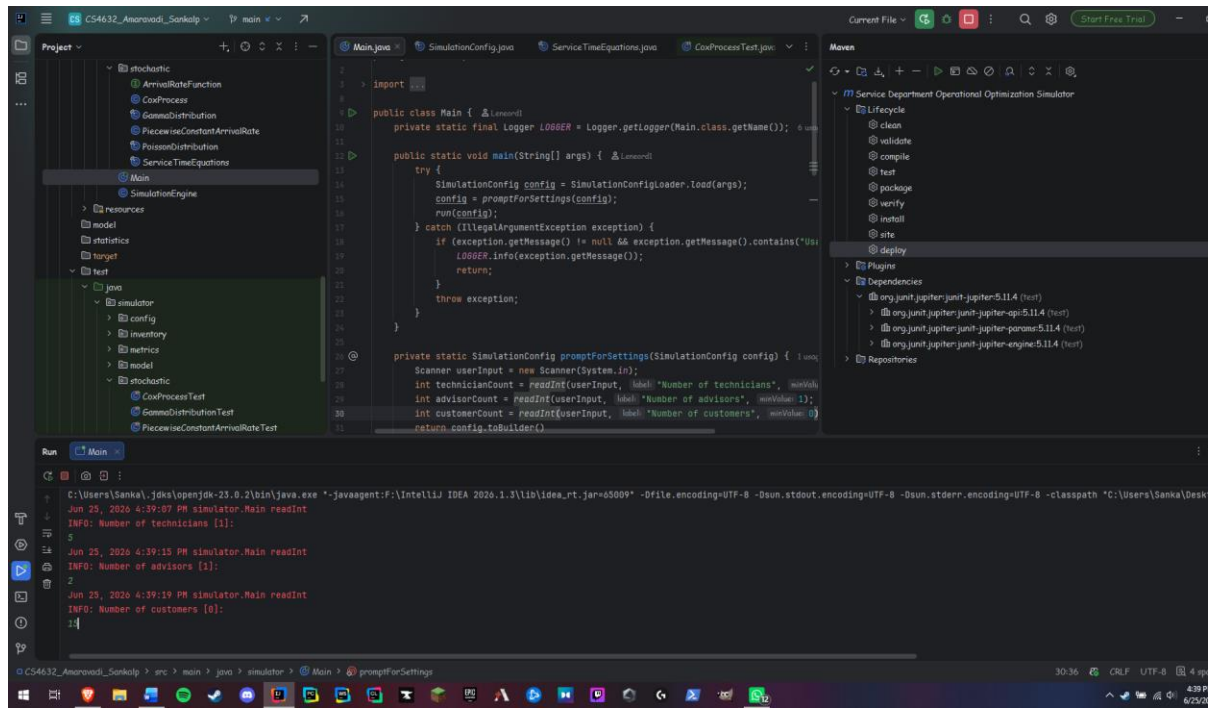

a.

Showing a successful compile of the system

b.

Testing suite completed successfully

c.

Users input information to the console in green

understand how to develop my UI. Next steps are to create the UI, finish the work and create a testing suite.

AI was used to assist me in building the project. I used Claude for assisting my planning stage. I verified the plan was feasible based on previous experience building projects. I used Cursor to assist in debugging the initial code creation. Additionally, I have added several CI/CD programs to create a basic pipeline to simulate a real production line such as a linter, a code analysis tool called SonarQube and am using the tools within IntelliJ to efficiently create code, find code smell and fix minor issues that may be overlooked. I verified that the debugging actually fixed the issue by using SonarQube and performing the tests again.
